

## ***Registered reports: why and how?***

“Registered reports” is a relatively new format of publication on which journals engage to publish a scientific article before experimental data collection, and hence independently of the scientific result, based exclusively on the rational of the scientific hypothesis and rigour of the proposed method to test it.

The aim of this mini-workshop is to:

- Discuss the advantages and disadvantage of this format.
- Present the procedure to prepare a submission for “Registered reports”.
- Share my experience on this format of publication.
